

I CLAIM:

1. A method of making a container, comprising:
forming a cover with a front hingedly connected to a spine by a first fold line, said spine hingedly connected to a back by a second fold line,
forming a tray with a front, a spine and a back separably attached to one another,
applying adhesive to said tray, and placing said tray on said cover, and
closing said cover and allowing said adhesive to cure.
2. The method of claim 1, further comprising forming a line of weakness between said tray front and tray spine and between said tray spine and said tray back.
3. The method of claim 2, further comprising forming said lines of weakness by perforating.
